

Figure 9. Comparison of 2x2 DD Components and Decomposition Weights with and without Population Weights

Notes: Panel A plots the 2x2 DD components from two-way fixed effects estimates that use population weights (y-axis) and do not (x-axis). The size of each point is proportional to its weight in an OLS version of equation (7). WLS estimates are much smaller than OLS estimates, and this figure shows that the source of this discrepancy is the 1970 no-fault divorce states, which include only Iowa and California. Weighting puts much more emphasis on California and, therefore, every 2x2 DD component involving the 1970 states. Dropping California changes yields an OLS estimate of -3.32 and a WLS estimate of -1.43.

Figure 10. Comparison of 2x2 DD Components and Decomposition Weights with and without Unit-Specific Linear Time Trends

Notes: Panel A plots the two-group DD's from a model with unit-specific time trends (y-axis) against those from a model without trends (x-axis). The size of each point is proportional to its weight in a model without trends. The trend-adjusted estimate is small and positive compared to a negative DD estimate without them. Much of the change comes from the effect of trends on each 2x2 estimate, especially for treated/untreated comparisons (closed triangles). Panel B is the same except that it plots the weights. Treated/untreated terms that received the most weight in the unadjusted model get relatively less in a trend-adjusted model. Timing terms that received more weight get relatively more in a trend-adjusted model.

Figure 11. Comparison of 2x2 DD Components and Decomposition Weights with and without Region-by-Year Fixed Effects

Notes: Panel A plots the two-group DD's from a model with region-by-year fixed effects (y-axis) against those from a model without them (x-axis). The size of each point is proportional to its weight in the sparser model with only year fixed effects. 2x2 DD's that drop out of the region-by-year FE model are shown in triangles and appear at "0" on the y-axis, although they do not enter the decomposition as zeros. Panel B plots the decomposition weights from the two models. Some 2x2 comparisons drop out in the model with region-by-year effects (when no region has states from both timing groups) and the figures plot these components using triangles.

Table 1. The No-Fault Divorce Rollout: Treatment Times, Group Sizes, and Treatment Shares

No-Fault Divorce Year (t_k^*)	Number of States	Share of States (n_k)	Treatment Share ($\bar{D}_k$)
Non-Reform States	5	0.10	.
Pre-1964 Reform States	8	0.16	.
1969	2	0.04	0.85
1970	2	0.04	0.82
1971	7	0.14	0.79
1972	3	0.06	0.76
1973	10	0.20	0.73
1974	3	0.06	0.70
1975	2	0.04	0.67
1976	1	0.02	0.64
1977	3	0.06	0.61
1980	1	0.02	0.52
1984	1	0.02	0.39
1985	1	0.02	0.36

Notes: The table lists the dates of no-fault divorce reforms from Stevenson and Wolfers (2006), the number and share of states that adopt in each year, and the share of periods each treatment timing group spends treated in the estimation sample from 1964-1996.
