

Table E.13 shows that coworker encouragement strongly predicts an individual worker’s own reported encouragement: the first-stage coefficient is approximately 1, with an F-statistic of 3,645. The strong correlation in reported employer encouragement at the workplace level supports our interpretation of these initiatives as centralized policies.

Table E.13: Relationship Between Self- and Coworker-Reported Encouragement

	Encouraged (1)
Coworker Encouragement (EBS)	1.181*** (0.020)
Coworker Female Share	-0.016 (0.011)
Coworker Age	0.001 (0.001)
Coworker Potential Experience	-0.001 (0.001)
Occupation FEs	✓
F-Stat (Partial)	3644.56
Observations	16974

Notes: This table reports the relationship between workers’ self-reported employer encouragement and those reported by their coworkers, estimated using the specification in Equation (71). Standard errors (in parentheses) are clustered at the workplace level. *F-Stat (Partial)* reports the F-statistic on the partial effect of Coworker Encouragement (EBS). *Sample:* The table is based on all completed responses from workplaces with at least two respondents from the 2024 survey linked to registry data.

In Section E.5.2, we estimate how employer encouragement affects the impact of AI chatbots, contrasting the effects of workers’ self-reported encouragement with those of their coworkers’. To ensure the effects are measured on comparable scales, and not attenuated by measurement error, we present 2SLS estimates for the impact of coworker-reported employer encouragement:

$$\text{Encouraged}_i = \pi' X_{j,-i} + \alpha \times \text{Encouraged}_{j,-i} + \varepsilon_{1i} \quad (71)$$

$$Y_i = \gamma' X_{j,-i} + \beta \times \widehat{\text{Encouraged}}_i + \varepsilon_{2i}, \quad (72)$$

where $X_{j,-i}$ denotes the leave-one-out mean of the characteristics X of worker i 's coworkers. Table E.13 reports estimates of Equation (71).

E.5.2 Results

Adoption and Work. Table E.14 and Figure E.21 compare the effects of self- and coworker-reported employer encouragement on AI chatbot adoption and associated benefits. The results broadly align, but with some interesting differences.

The impact of coworker-reported encouragement on adoption (Panel (a)) is 1.5–2 times larger than the effect of self-reported encouragement. Furthermore, Figure E.21.(b) shows that coworker encouragement can entirely eliminate the gender gap in AI chatbot adoption. By contrast, coworker encouragement has a more muted effect on reported benefits among adopters (Panel (b)). For example, self-reported encouragement increases the share of workers reporting time savings by 10 percentage points, whereas the effect of coworker encouragement is only 5.3 percentage points. Finally, Panel (d) shows that coworker encouragement has roughly twice the effect of self-reported encouragement on the creation of new tasks among adopters.

Taken together, these results suggest that workplace-wide encouragement (captured by coworker reports) significantly boosts chatbot adoption and leads to broader organizational changes that induce task creation. However, individual-level benefits—such as perceived time savings—appear more sensitive to whether workers personally feel encouraged, as measured by self-reports.

Table E.14: Encouragement, Adoption, and Work (Own vs. Coworker Reports)

(a) Adoption								
	Ever Used		Monthly or More		Weekly or More		Daily	
	Own (1)	CWs (2)	Own (3)	CWs (4)	Own (5)	CWs (6)	Own (7)	CWs (8)
Encouraged	0.363 (0.007)	0.725 (0.022)	0.337 (0.007)	0.640 (0.022)	0.285 (0.007)	0.506 (0.021)	0.137 (0.005)	0.228 (0.017)
(b) Reported Benefits								
	Time Savings		Quality		Creativity		Job Satisfaction	
	Own (1)	CWs (2)	Own (3)	CWs (4)	Own (5)	CWs (6)	Own (7)	CWs (8)
Encouraged	0.100 (0.008)	0.053 (0.031)	0.116 (0.009)	0.090 (0.033)	0.091 (0.009)	0.088 (0.031)	0.071 (0.007)	0.026 (0.025)
(c) Allocation of Time Savings								
	More of Same Tasks		More of Diff. Tasks		More Breaks		More Leisure	
	Own (1)	CWs (2)	Own (3)	CWs (4)	Own (5)	CWs (6)	Own (7)	CWs (8)
Encouraged	0.031 (0.009)	0.035 (0.035)	0.016 (0.007)	0.037 (0.024)	-0.007 (0.005)	-0.016 (0.016)	-0.011 (0.006)	-0.010 (0.019)
(d) New Workloads from AI Chatbots (Adopters)								
	Same Tasks		New Tasks		Same and New Tasks			
	Own (1)	CWs (2)	Own (3)	CWs (4)	Own (5)	CWs (6)		
Encouraged	0.016 (0.004)	0.018 (0.012)	0.045 (0.006)	0.106 (0.021)	0.008 (0.002)	0.014 (0.008)		

Notes: This table presents estimates of the impact of employer encouragement on: AI chatbot adoption (Panel a), reported benefits of adoption (Panel b), the allocation of time savings (Panel c), and new workloads resulting from chatbot use among adopters (Panel d). Odd-numbered columns (“Own”) show the impact of self-reported encouragement, estimated using the specification in Equation (69). Even-numbered columns (“CWs”) show the impact of coworker-reported encouragement, estimated using the specifications in Equations (71)–(72). Standard errors (in parentheses) are clustered at the workplace level. *Sample:* “Own” columns use all complete responses from the 2024 survey that can be linked to registry data. “CWs” columns include complete responses from workplaces with at least two linked respondents in the 2024 survey.

Figure E.21: Encouragement and Worker Gaps in Adoption (Own vs. Coworker Reports)

Notes: This figure presents the impact of coworker encouragement on worker disparities in AI chatbot adoption. The estimates are obtained from a multivariate regression of AI chatbot adoption on worker characteristics X , controlling for occupation-fixed effects, and all interacted with an indicator for employer encouragement. In Panel (b), we instrument these interaction effects using the corresponding interactions with our coworker encouragement variable. The point estimates show predicted adoption rates for an average worker, $\bar{X}$, when Encouraged = 0 or 1, respectively. Whiskers denote 95% confidence intervals. Reported p-values test whether the coefficients differ between the two groups. *Sample:* All completed responses from the 2024 survey linked to registry data.
