

Figure A32: Employment changes by age and exposure quintile using measures from [Eloundou et al. \(2024\)](#). Data come from the monthly CPS.

Table A1: Example occupations by exposure category

Metric	Least exposed (examples)	Most exposed (examples)
Eloundou et al. (2024) GPT-4 β	• Maintenance and Repair Workers, General • Nursing, Psychiatric, and Home Health Aides • Laborers and Freight, Stock, and Material Movers, Hand • Maids and Housekeeping Cleaners	• Customer Service Representatives • Accountants and Auditors • Software Developers, Applications and Systems Software • Secretaries and Administrative Assistants
Handa et al. (2025) (Overall)	• Taxi Drivers and Chauffeurs • First-Line Supervisors of Production and Operating Workers • Laborers and Freight, Stock, and Material Movers, Hand • Maids and Housekeeping Cleaners	• Computer Programmers • Financial Managers • Accountants and Auditors • Sales Representatives, Wholesale and Manufacturing
Handa et al. (2025) (Automation)	• Maintenance and Repair Workers, General • Managers, All Other • Nursing, Psychiatric, and Home Health Aides • Driver/Sales Workers and Truck Drivers	• General and Operations Managers • Accountants and Auditors • Software Developers, Applications and Systems Software • Receptionists and Information Clerks
Handa et al. (2025) (Augmentation)	• Cooks • Welding, Soldering, and Brazing Workers • Tellers • Drafters	• Chief Executives • Maintenance and Repair Workers, General • Registered Nurses • Computer and Information Systems Managers

Automative Behaviors	Augmentative Behaviors
<i>AI directly executes tasks with minimal human involvement</i>	AI enhances human capabilities through collaboration
Directive: Complete task delegation with minimal interaction <i>Illustrative Example: “Format this technical documentation in Markdown”</i>	Task Iteration: Collaborative refinement process <i>Illustrative Example: “Let’s draft a marketing strategy for our new product. ... Good start, but can we add some concrete metrics?”</i>
Feedback Loop: Task completion guided by environmental feedback <i>Illustrative Example: “Here’s my Python script for data analysis – it’s giving an IndexError. Can you help fix it? ... Now I’m getting a different error...”</i>	Learning: Knowledge acquisition and understanding <i>Illustrative Example: “Can you explain how neural networks work?”</i>
	Validation: Work verification and improvement <i>Illustrative Example: “I’ve written this SQL query to find duplicate customer records. Can you check if my logic is correct and suggest any improvements?”</i>

Table A2: Table 1 from [Handa et al. \(2025\)](#). [Handa et al. \(2025\)](#) classify conversations from Claude, the LLM, into five distinct patterns across two broad categories based on how people integrate AI into their workflow.

B Additional Literature

Numerous media articles have highlighted the potential employment effects of AI.²⁸ Some work has noted that the unemployment rate for college graduates has risen above the rate for non-graduates, suggesting this as evidence of employment disruptions from AI (Thompson, 2025). Others have noted that these trends long preceded the spread of AI and have noted that publicly available data such as the Current Population Survey (CPS) show mixed evidence on employment changes in AI-exposed occupations (Lim et al., 2025; The Economist, 2025; Smith, 2025; Eckhardt and Goldschlag, 2025; Frick, 2025).²⁹ A number of technology executives have also warned of potential job loss from AI (Allen, 2025; Sherman, 2025; Bacon, 2025) or laid off workers with the aim of increasing AI investments (Jamali, 2025).

C Comparison to CPS Data

The CPS surveys about 60,000 households nationwide each month to collect data on employment and other labor force characteristics. These data are released a few weeks after the reference month, giving close to real-time estimates of employment statistics. A number of prior analyses have used the CPS to assess how AI is impacting entry-level work (Chandar, 2025b; Dominski and Lee, 2025; Lim et al., 2025; Eckhardt and Goldschlag, 2025). We compare some of our main findings in the ADP data to estimates from the CPS.

Figures A29 through A31 show employment changes by age for software developers, customer service representatives, and home health aides by age using data from the CPS. Though there are millions of workers employed in these professions across the US, the estimates are highly volatile, with common fluctuations of 20% or greater in estimated employment month-to-month. Figure A32 shows estimated employment changes by age and exposure quintile using the CPS, also suggesting a high degree of volatility in the estimates.

²⁸See Horowitch (2025); Ettenheim (2025); Peck (2025); Hoover (2025); Milmo and Almeida (2025); Wu (2025).

²⁹Reports from industry have also shown mixed findings. Job posting platform TrueUp suggests a recent increase in postings in the tech sector (Lenny Rachitsky, 2025). On the other hand, Revelio Labs finds a decline in job postings, with the decrease steeper for entry-level workers (Simon, 2025). Indeed job posting data suggest declines in postings for new graduates but find these declines for less AI-exposed occupations as well (Lim et al., 2025). Chandar (2025b) notes that the correlation between job postings and employment has been weak over recent years. SignalFire finds steep declines in new graduate hires in the tech sector compared to pre-Pandemic levels (Doshay and Bantock, 2025), consistent with the findings in this paper. Data from Gusto also suggests a decline in new graduate hiring (Bowen, 2025).
