

Figures and Tables

Figure 1: Employer Initiatives for AI Chatbot Use

Notes: Panel (a) shows, by occupation, the share of workers subject to different employer policies on the use of AI chatbots for work. Figure F.1 provides a workplace-level version of this graph, yielding similar results. Panel (b) shows the share of workers affected by different combinations of employer-led initiatives for chatbot adoption. Workers are grouped by whether their chatbot use is employer-encouraged or not. Within each group, the bars indicate the share of workers whose employer provides an enterprise AI chatbot, provide chatbot training, or both. *Sample:* All completed responses from the 2024 survey.

Figure 2: Chatbot Adoption by Employer Initiatives

Notes: This figure illustrates how workers' use of AI chatbots vary with their employer initiatives. The estimates are based on predicted values from Equation (1), varying EmployerInitiatives while holding workers' characteristics X at their mean values. Whiskers represent 95% confidence bands of the predicted values. Some confidence intervals are too narrow to be distinguished from the point estimates at this scale. Table 1, Columns (1)-(2) report the full set of regression estimates.

Sample: All completed responses from the 2024 survey linked to registry data.

Figure 3: New Workloads From AI Chatbots by Employer Initiatives

Notes: This figure illustrates how new workloads created by AI chatbots vary with employer initiatives. Panel (a) presents results for adopters (i.e., workers who have ever used AI chatbots for work), while Panel (b) focuses on non-adopters. Estimates are predicted values from Equation (1), varying EmployerInitiatives while holding workers' characteristics X at their mean values. Whiskers represent 95% confidence bands of the predicted values. Some confidence intervals are too narrow to be distinguished from the point estimates at this scale. Table 1, Columns (7)-(10) report the full set of regression estimates. *Sample:* All completed responses from the 2024 survey linked to registry data.

Figure 4: Composition of AI Tasks

Notes: This figure shows the distribution of reported new job tasks across major task categories for each occupation. *AI Ideation* refers to “using AI to generate or expand creative ideas, such as concepts, strategies, or solutions,” *AI Content Drafting* refers to “using AI tools to produce initial drafts of text or media,” *AI Quality Review* refers to “reviewing and correcting AI-generated content for accuracy, clarity, and relevance,” *AI Data Insights* refers to “using AI to analyze data or documents and extract key patterns or insights,” *AI Integration* refers to “embedding AI into workflows to automate or enhance tasks,” and *AI Ethics & Compliance* refers to “ensuring AI use follows ethical, legal, and organizational standards.” See Appendix B.3 for details and occupation-specific examples. Tasks are ordered according to their average shares among the eleven occupations. Occupations are ordered according to their shares of *AI Integration*, the most frequent tasks across the occupations. *Sample:* All completed responses from the 2024 survey who reported new job tasks due to AI chatbots.
