

since employment effects cancel in aggregate. Combining:

$$\mathbb{E}[d \log W_0] = -\frac{1}{\epsilon} \left[ A_0 \cdot \Delta_{\text{NE}, \text{A-NE}, \text{NA}}^Y - E \cdot \Delta_{\text{E-NE}}^N \right] \quad (46)$$

$$+ \frac{\eta - \epsilon}{\epsilon \eta} \left[ (1 - E) A_0 \cdot \Delta_{\text{NE}, \text{A-NE}, \text{NA}}^Y + E A_1 \cdot \Delta_{\text{E}, \text{A-E}, \text{NA}}^Y \right], \quad (47)$$

where all terms are identified by existing difference-in-differences estimates, up to calibrated demand elasticities  $\eta$  and  $\epsilon$ . Crucially, when both  $\Delta^N$  and  $\Delta^Y$  are approximately zero (as in Figures 5 and 8), this implies that the missing intercept  $\mathbb{E}[d \log W_0]$  is also close to zero.

## B Data Construction

### B.1 Sampling Protocol

Our 2024 survey invited 115,000 workers across 11 occupations. Ideally, we would sample an equal number from each—i.e., 10,450 journalists, 10,450 software developers, etc. However, some occupations in Denmark employ fewer than 10,450 workers. To address this, we follow these steps:

1. If an occupation has fewer than 10,450 workers, we sample all available workers.
2. The remaining invitations are redistributed equally among the other occupations.
3. Workplaces are randomly selected for sampling, and if chosen, all relevant workers (i.e., those in the target occupation) within the workplace are included.
4. Large workplaces can distort the sample balance. To mitigate this, we apply individual-level sampling to the top 2.5% of workplaces (ranked by the number of employees in the relevant occupation), randomly selecting employees using the same sampling probability as in Step 3.
5. To precisely reach our target of 115,000 workers, we make final adjustments by randomly including or excluding workers, independent of their workplace.

The 2023 survey followed a similar protocol, with minor modifications; see Humlum and Vestergaard (2025) for details.

## B.2 Survey Sample

Table B.1 outlines how successive sample restrictions define our analysis sample. In total, we obtained about 25,000 complete and valid responses per survey round that can be linked to registry data. The attrition and response rates in our survey are comparable to those obtained in previous Danish surveys (Hvidberg, Kreiner and Stantcheva, 2023). While our main analysis focuses on responses from the 2024 round, we use the 2023 round to examine the dynamics of our estimated effects.

Table B.1: Sample Construction

|                            | <i>2024 Survey</i> |                     | <i>2023 Survey</i> |                     |                       |                     |
|----------------------------|--------------------|---------------------|--------------------|---------------------|-----------------------|---------------------|
|                            | Individuals        | Percent of invitees | <i>Main Survey</i> |                     | <i>Follow-Up Only</i> |                     |
|                            |                    |                     | Individuals        | Percent of invitees | Individuals           | Percent of invitees |
| 1. Invitees                | 115,000            | 100.0               | 100,000            | 100.0               | 15,000                | 100.0               |
| 2. Respondents             | 30,411             | 26.4                | 29,067             | 29.1                | 4,094                 | 27.3                |
| 3. In target occupation(s) | 26,925             | 23.4                | 25,121             | 25.1                | 3,504                 | 23.4                |
| 4. Complete responses      | 25,241             | 21.9                | 18,109             | 18.1                | 2,561                 | 17.1                |
| 5. Linked to registers     | 24,796             | 21.6                | 17,907             | 17.9                | 2,559                 | 17.1                |

*Notes:* This table outlines how successive sample restrictions define our analysis sample. We conducted two survey rounds in November 2023 and 2024, each inviting 115,000 workers to participate. The 2023 survey included both a main survey and a two-week follow-up, with 15,000 workers invited only to the follow-up. Row 2 reports the number of individuals who responded to the survey. Row 3 shows the respondents who were still employed in one of our 11 target occupations at the time of the surveys. Row 4 presents the respondents who fully completed the survey questionnaire. Row 5 indicates the complete responses that could be linked to registry data.

### B.2.1 Representativeness and Response Quality

In this section, we extend the checks of representativeness and response quality provided in Humlum and Vestergaard (2025) to include the 2024 survey round.

Table B.2 shows that our survey respondents resemble our survey populations on observable characteristics.

Table B.2: Balance Table for Survey Respondents

|                   | <i>2024 Survey</i>  |                  |                  | <i>2023 Main Survey</i> |                  |                  |
|-------------------|---------------------|------------------|------------------|-------------------------|------------------|------------------|
|                   | Population<br>(1)   | Sampled<br>(2)   | Responded<br>(3) | Population<br>(1)       | Sampled<br>(2)   | Responded<br>(3) |
| Age               | 42.93<br>(11.54)    | 42.94<br>(11.52) | 46.11<br>(11.50) | 42.41<br>(11.57)        | 42.40<br>(11.57) | 45.38<br>(11.51) |
| Female            | 0.56<br>(0.50)      | 0.56<br>(0.50)   | 0.56<br>(0.50)   | 0.52<br>(0.50)          | 0.52<br>(0.50)   | 0.49<br>(0.50)   |
| log(Earnings)     | 12.98<br>(0.70)     | 12.98<br>(0.70)  | 13.01<br>(0.64)  | 13.07<br>(0.58)         | 13.07<br>(0.59)  | 13.11<br>(0.53)  |
| Experience        | 6.11<br>(4.80)      | 6.11<br>(4.80)   | 7.24<br>(4.92)   | 6.05<br>(4.58)          | 6.05<br>(4.57)   | 7.12<br>(4.67)   |
| Wealth / Earnings | 10.92<br>(2,148.09) | 6.50<br>(286.36) | 6.74<br>(204.16) | 4.09<br>(157.40)        | 4.87<br>(262.31) | 4.10<br>(39.57)  |
| Observations      | 284,439             | 115,000          | 25,241           | 283,806                 | 100,000          | 18,109           |

*Notes:* This table compares the mean characteristics of workers in our population (Column 1), our sampled survey invitees (Column 2), and survey respondents with complete responses (Column 3) for each survey round. The *Sampled* columns correspond to line 1 of Table B.1. The *Responded* columns correspond to line 4 of Table B.1. *Population* columns (1) show a difference in the female share between the 2023 and 2024 survey rounds that warrants explanation. This difference arises from a slight modification to the sampling protocol in 2023, in which some sampled workplaces had only (a random) 50% of their relevant workers invited to the survey. This altered the weight each of our 11 occupations received in the invite population, leading to the shifts in gender share observed in columns (1). Importantly, and as expected, the gender composition of the survey population *within* each of our 11 occupations remains virtually unchanged between survey rounds, as does the total unweighted worker population (i.e., without reweighting occupations to reflect our sampling protocol). Since all analyses include occupation fixed effects, this change in occupational composition across survey rounds does not affect our results. Moreover, nearly all analyses in this paper rely on the 2024 survey round, which did not involve the sampling protocol modification. *Sample:* The table includes all individuals in our survey population.
