

Figure F.2: Have Adopting Workers Experienced Earnings Gains?
(Log Earnings Relative to Non-Encouraged Non-Adopters)

Notes: This figure presents the differential labor market outcomes of AI chatbot adopters relative to non-adopters, indexed to the launch of ChatGPT in November 2022. Effects are estimated separately for adopters whose employers encourage AI chatbot use (“Encouraged”) and those without encouragement (“Non-Encouraged”). Each group is compared to non-encouraged non-adopters. Estimates are based on the dynamic difference-in-differences specification in Equation (2). Shaded areas represent 95% confidence intervals. *Sample:* All completed responses from the 2024 survey linked to registry data.

Figure F.3: Have Adopting Workers Experienced Earnings Gains?
(Log Earnings Relative to Non-Encouraged Non-Adopters)

Notes: This figure shows the earnings gap of workers according to their encouragement and adoption status. Each group is compared to non-encouraged non-adopters. The figure reports the difference in log earnings, controlling for occupation fixed effects and pre-determined worker characteristics. Shaded areas represent 95% confidence intervals. *Sample:* All completed responses from the 2024 survey linked to registry data.

Figure F.4: Have Encouraged Workers Fared Differently?

(a) Log Earnings and Log Hours

(b) Occupational Heterogeneity: Log Earnings

Notes: This figure presents the differential labor market outcomes of workers who are encouraged to use AI chatbots by their employers, compared to all other workers, indexed to the launch of ChatGPT in November 2022. Panel (a) is based on the dynamic difference-in-differences specification in Equation (2), with shaded areas representing 95% confidence intervals. The corresponding “first-stage” effect on adoption is 0.363 (0.006). Panel (b) first shows a pooled estimate (*All*) and then reports impacts separately for each of our 11 study occupations. These effects are based on the pooled difference-in-differences specification in Equation (3), with whiskers representing 95% confidence intervals. *Sample:* All completed responses from the 2024 survey linked to registry data.

F.3 Job Mobility

Our main analysis in Section 3.3 focuses on occupational mobility. In addition, AI chatbots may also induce mobility across workplaces. For instance, if chatbots help workers move up firm-specific learning curves, adopters may be more likely to switch employers. Alternatively, if encouraged-use policies enhance the utility of chatbots (as shown in Section 2.2), adopters may seek to sort into such workplaces. This prediction is formalized in our theoretical framework in Appendix A.2. Despite these possibilities, Figure F.5 shows only a weak link between chatbot adoption and workplace mobility (Panel a). Moreover, job mobility effects—across either workplaces or occupations—are not stronger among adopters whose use is encouraged by their endline employers (Panel b).
