

assess whether effects reflect workplace-wide initiatives or individual interventions; at the workplace level, it addresses concerns about attenuation bias from survey measurement error.

We focus the robustness analysis on encouraged use, our primary workplace treatment. Section F.6.1 describes how we construct coworker measures, and Section F.6.2 shows that our findings hold when using coworker encouragement, replicating first the adoption and self-reported work effects from Section 2.2, then the labor market results from Section 3.

### F.6.1 Empirical Strategy

To operationalize these ideas, we construct leave-one-out averages of coworkers' reported employer encouragement for each worker  $i$ :

$$\text{Encouraged}_{j,-i} = \frac{1}{N_{j(i)} - 1} \sum_{k \in j(i) \setminus i} \text{Encouraged}_k, \quad (48)$$

where  $N_{j(i)}$  denotes the number of respondents in the same workplace-occupation cell  $j(i)$  as worker  $i$ .

The coworker measurements are made possible by our workplace-based sampling design (described in Section 1.3), which ensures that most respondents have coworkers who also participated in the survey. To mitigate measurement error due to incomplete sample coverage, we apply an empirical shrinkage procedure to the leave-out encouragement rates,  $\text{Encouraged}_{j,-i}$  (see Appendix G.1 for details on this method). Importantly, our results in Section F.6.2 are robust to using the raw leave-out means instead.

Table F.3 shows that coworker encouragement strongly predicts an individual worker's own reported encouragement: the first-stage coefficient is approximately 1, with an F-statistic of 3,116. The strong correlation in reported employer encouragement at the workplace level supports our interpretation of these initiatives as centralized policies.

Table F.3: Relationship Between Self- and Coworker-Reported Encouragement

|                                | (1)                 |
|--------------------------------|---------------------|
|                                | Encouraged          |
| Coworker IV (Leave Out, EBS)   | 0.877***<br>(0.016) |
| Coworkers Share Female         | -0.016<br>(0.011)   |
| Coworkers Age                  | 0.001<br>(0.001)    |
| Coworkers Potential Experience | -0.001<br>(0.001)   |
| Occupation FEs                 | ✓                   |
| F-Stat (Partial)               | 3116.352            |
| Observations                   | 16974               |

*Notes:* This table reports the relationship between workers' self-reported employer encouragement and those reported by their coworkers, estimated using the specification in Equation (49). Standard errors (in parentheses) are clustered at the workplace level. *F-Stat (Partial)* reports the F-statistic on the partial effect of Coworker Encouragement (EBS). *Sample:* The table is based on all completed responses from workplaces with at least two respondents from the 2024 survey linked to registry data.

In Section F.6.2, we estimate how employer encouragement affects the impact of AI chatbots, contrasting the effects of workers' self-reported encouragement with those of their coworkers'. To ensure the effects are measured on comparable scales, and not attenuated by measurement error, we present 2SLS estimates for the impact of coworker-reported employer encouragement:

$$\text{Encouraged}_i = \pi' X_{j,-i} + \alpha \times \text{Encouraged}_{j,-i} + \varepsilon_{1i} \quad (49)$$

$$Y_i = \gamma' X_{j,-i} + \beta \times \widehat{\text{Encouraged}}_i + \varepsilon_{2i}, \quad (50)$$

where  $X_{j,-i}$  denotes the leave-one-out mean of the characteristics  $X$  of worker  $i$ 's coworkers. Table F.3 reports estimates of Equation (49).

### F.6.2 Results

**Adoption and Work.** Table F.4 compares the effects of self- and coworker-reported employer encouragement on AI chatbot adoption and associated benefits. The results broadly align, but with some interesting differences.

The impact of coworker-reported encouragement on adoption (Panel (a)) is 1.5–2 times larger than the effect of self-reported encouragement. By contrast, coworker encouragement has a more muted effect on reported benefits among adopters (Panel (b)). For example, self-reported encouragement increases the share of workers reporting time savings by 10 percentage points, whereas the effect of coworker encouragement is only 5.3 percentage points. Finally, Panel (d) shows that coworker encouragement has roughly twice the effect of self-reported encouragement on the creation of new tasks among adopters.

Taken together, these results suggest that workplace-wide encouragement (captured by coworker reports) significantly boosts chatbot adoption and leads to broader organizational changes that induce task creation. However, individual-level benefits—such as perceived time savings—appear more sensitive to whether workers personally feel encouraged, as measured by self-reports.

Table F.4: Encouragement, Adoption, and Work (Own vs. Coworker Reports)

| (a) Adoption                                  |                    |                  |                     |                  |                    |                   |                   |                   |
|-----------------------------------------------|--------------------|------------------|---------------------|------------------|--------------------|-------------------|-------------------|-------------------|
|                                               | Ever Used          |                  | Monthly or More     |                  | Weekly or More     |                   | Daily             |                   |
|                                               | Own<br>(1)         | CWs<br>(2)       | Own<br>(3)          | CWs<br>(4)       | Own<br>(5)         | CWs<br>(6)        | Own<br>(7)        | CWs<br>(8)        |
| Encouraged                                    | 0.363<br>(0.007)   | 0.727<br>(0.021) | 0.337<br>(0.007)    | 0.638<br>(0.020) | 0.285<br>(0.007)   | 0.505<br>(0.020)  | 0.137<br>(0.005)  | 0.220<br>(0.015)  |
| (b) Reported Benefits                         |                    |                  |                     |                  |                    |                   |                   |                   |
|                                               | Time Savings       |                  | Quality             |                  | Creativity         |                   | Job Satisfaction  |                   |
|                                               | Own<br>(1)         | CWs<br>(2)       | Own<br>(3)          | CWs<br>(4)       | Own<br>(5)         | CWs<br>(6)        | Own<br>(7)        | CWs<br>(8)        |

| (d) New Workloads from AI Chatbots (Adopters) |                    |                  |                     |                  |                    |                   |                   |                   |
|                                               | Same Tasks         |                  | New Tasks           |                  | Same and New Tasks |                   |                   |                   |
|                                               | Own<br>(1)         | CWs<br>(2)       | Own<br>(3)          | CWs<br>(4)       | Own<br>(5)         | CWs<br>(6)        |                   |                   |
| Encouraged                                    | 0.016<br>(0.004)   | 0.015<br>(0.011) | 0.045<br>(0.006)    | 0.107<br>(0.020) | 0.008<br>(0.002)   | 0.014<br>(0.008)  |                   |                   |

*Notes:* This table presents estimates of the impact of employer encouragement on: AI chatbot adoption (Panel a), reported benefits of adoption (Panel b), the allocation of time savings (Panel c), and new workloads resulting from chatbot use among adopters (Panel d). Odd-numbered columns (“Own”) show the impact of self-reported encouragement, estimated using the specification in Equation (1). Even-numbered columns (“CWs”) show the impact of coworker-reported encouragement, estimated using the specifications in Equations (49)–(50). Standard errors (in parentheses) are clustered at the workplace level. *Sample:* “Own” columns use all complete responses from the 2024 survey that can be linked to registry data. “CWs” columns include complete responses from workplaces with at least two linked respondents in the 2024 survey.

**Workplace Employment.** Figure F.10 revisits the impact of employer encouragement on workplace employment outcomes (Figure 8), now using our leave-out Bayes shrinkage measure for employer encouragement. The figure shows that all our difference-in-differences estimates are robust to using coworker reports to measure employer encouragement.
